■ SAFETY PRECAUTION (This "safety precaution" is applied only in U.S.A.)

1. Before servicing, unplug the power cord to prevent an electric shock.
2. When replacing parts, use only manufacturer's recommended components for safety.
3. Check the condition of the power cord. Replace if wear or damage is evident.
4. After servicing, be sure to restore the lead dress, insulation barriers, insulation papers, shields, etc.
5. Before returning the serviced equipment to the customer, be sure to make the following insulation resistance test to prevent the customer from being exposed to a shock hazard.

• INSULATION RESISTANCE TEST

1. Unplug the power cord and short the two prongs of the plug with a jumper wire.
2. Turn on the power switch.
3. Measure the resistance value with ohmmeter between the jumpered AC plug and each exposed metal cabinet part, such as screwheads antenna, control shafts, handle brackets, etc. Equipment with antenna terminals should read between $3M\Omega$ and $5.2M\Omega$ to all exposed parts. (Fig. A) Equipment without antenna terminals should read approximately infinity to all exposed parts. (Fig. B)

Note: Some exposed parts may be isolated from the chassis by design. These will read infinity.

(Fig. A)

Resistance = $3M\Omega$ — $5.2M\Omega$

(Fig. B)

Resistance = Approx ∞

4. If the measurement is outside the specified limits, there is a possibility of a shock hazard. The equipment should be repaired and rechecked before it is returned to the customer.

HEAD AZIMUTH ADJUSTMENT

1. Playback the azimuth adjusted part (8kHz, -20dB) of the test tape (QZZCFM) and regulate the angle adjusting screw so that the outputs of L-CH and R-CH are maximized.

(When the adjusting positions are different with L-CH and R-CH, find a position where the outputs of L-CH and R-CH are balanced, and then make the adjustment.)

2. At the same time, obtain a lissajous waveform and eliminate phase deflection.
3. After adjustment, lock the tape guide height and angle adjustment screws.

TAPE SPEED ADJUSTMENT

High speed

1. Set the editing tape speed switch to "X2" and connect the Deck A = TP1 and TPN1, Deck B = TP2 and TPN2.
2. Playback the middle part of the test tape (QZZCWAT).
3. Adjust Deck A = VR803 so that the output is within the standard.

Normal speed

4. Set the editing tape speed switch to "X1" and open the Deck A = TP1 and TPN1, Deck B = TP2 and TPN2.
5. Playback the middle part of the test tape (QZZCWAT).
6. Adjust Deck A = VR801 and Deck B = VR802 so that the output is within the standard.

Standard value: $3000 \pm 15\text{Hz}$ (Normal), $6000 \pm 630\text{Hz}$ (High)

PLAYBACK FREQUENCY RESPONSE

1. Playback the playback frequency response part (315Hz, 12.5kHz ~ 63Hz, -20dB) of the test tape (QZZCFM).
2. Check that the frequency is within the range shown in Fig.1 for both L-CH and R-CH. (See page 9.)

PLAYBACK GAIN ADJUSTMENT

1. Playback the playback gain adjusted part (315Hz, 0dB) of the test tape (QZZCFM).
2. Adjust Deck B = VR1(L-CH) (VR2(R-CH)) and Deck A = VR3(L-CH) (VR4(R-CH)) so that the output is within the standard.

Standard value: $0.4 \pm 0.02\text{V}$

OVERALL FREQUENCY RESPONSE

1. Set a normal blank tape (QZZCRA) and record by applying signal (50Hz ~ 12.5kHz), 20dB attenuated from the reference input level signal (1kHz, -24dB).
2. Playback the signal recorded in step 1, and check that the level of each output frequency is within the range shown in Fig.2 in comparison with the reference frequency (1kHz).

3. If it is not within the standard range, adjust the bias current by Deck A = VR301(L-CH) (Deck A = VR302(R-CH)) so that the frequency level is within the standard.

- Level up in high frequency range.....Increase the bias current.
- Level down in high frequency range...Decrease the bias current.

4. After that, increase the signal recorded on CrO₂ blank tape (QZZCRX) and metal blank tape (QZZCRZ) up to 14kHz and adjust in the same way as mentioned above and check that the frequency level is within the range shown in Fig.3.

OVERALL GAIN ADJUSTMENT

1. Set a normal blank tape (QZZCRA) and apply the reference input level signal (1kHz, -24dB) in record pause mode.
2. Adjust the output 0.4V by attenuator and then record.
3. Playback the signal recorded in step 2, and check that the output is within the standard.
4. If it is not within the standard, adjust Deck A = VR5(L-CH) ((Deck A = VR6(R-CH))) and repeat the step (1), (2) and (3) until the output is within the standard.

Standard value: $0.4V \pm 0.5dB(0.02V)$

DOLBY NR CIRCUIT

1. Set a normal tape and apply 5kHz signal in record pause mode.
2. Adjust by attenuator so that the output between terminal 6(L-CH) ((terminal 19(R-CH))) of IC401 and ground is 12.3mV.
3. Turn NR switch ON, and check that the level changes as specified from the level in NR out mode.
